

PATINA INFORMATION SHEET

*d'Officina
by Vincenzo*

Patina is a tarnish produced by oxidation or chemical process on the surface of bronze or similar metals which provides a protective covering that would otherwise be damaged by corrosion or weathering.

L'Officina by Vincenzo will provide a unique patina application to the mild steel and other metals such as bronze, brass and zinc. Our technique is to apply the patina to the metal surface to simulate antiquity with colour and texture in our newly made objects.

The preparation prior to the application of the patina is 70% of the process. We then enhance the patinated surface with a clear paint coating, applying wax and oil coating.
